

Monitoring of PCBs in Swedish aquatic biota and human milk, 1969-2014

ELISABETH NYBERG, ANDERS BIGNERT, SARA DANIELSSON, ANNA-LENA
EGEBÄCK, CAROLINE EK, ULLA ERIKSSON

Elisabeth.Nyberg@nrm.se

Outline

- Background
- National monitoring programs
 - freshwater
 - marine
 - human health
- Results – temporal and spatial

Background

- The Baltic Sea polluted by e.g. PCBs, HCHs, HCB and DDTs in the 1960s
- Adverse effects in Baltic biota e.g. seals and white tailed sea eagle
- Ongoing monitoring programme for contaminants in biota at reference stations

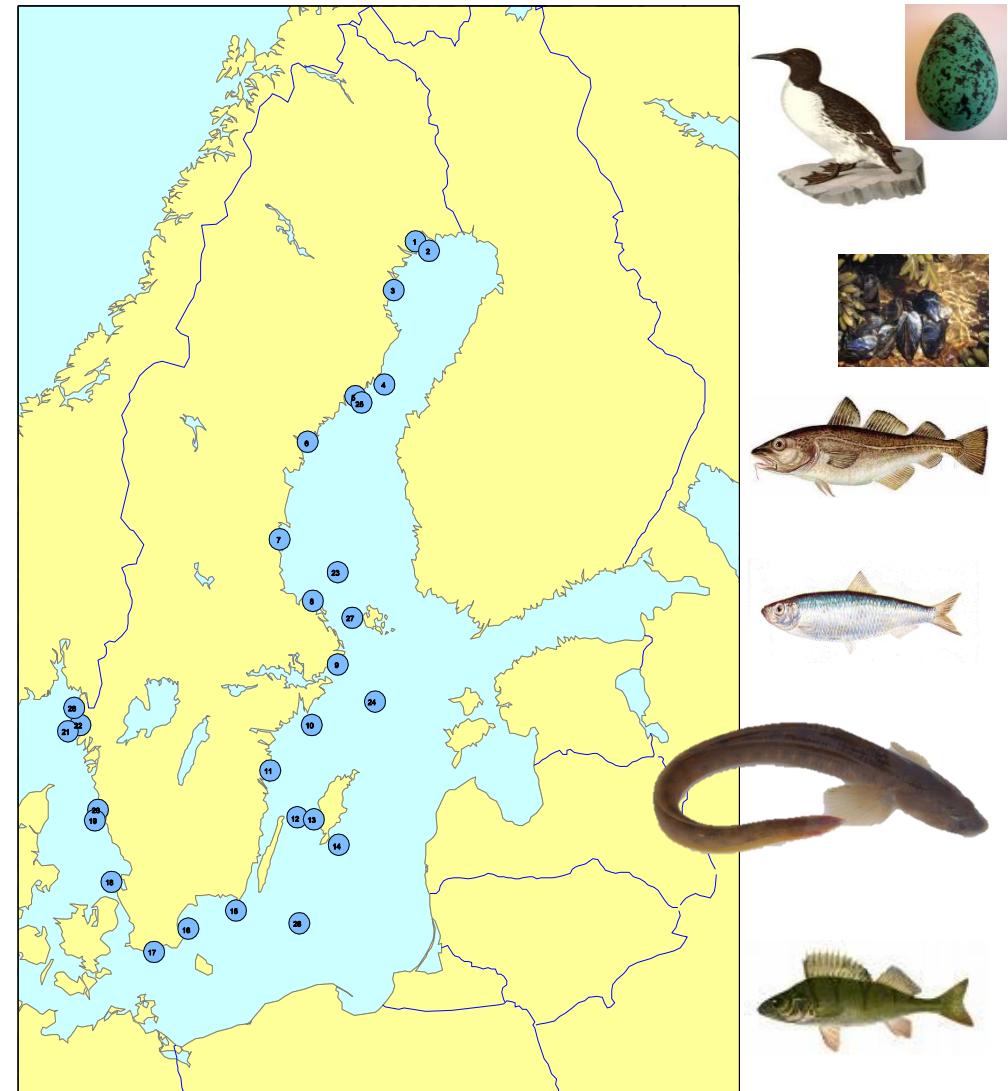

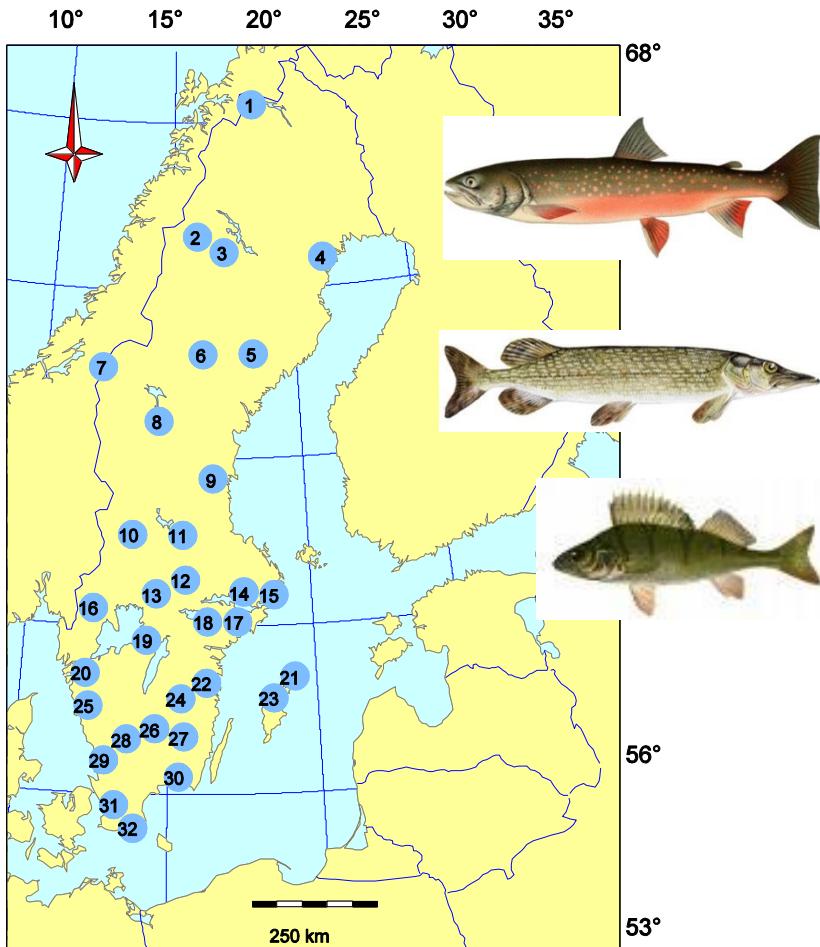

Malformed WTS, 1978

Monitoring programs biota

Naturhistoriska
riksmuseet

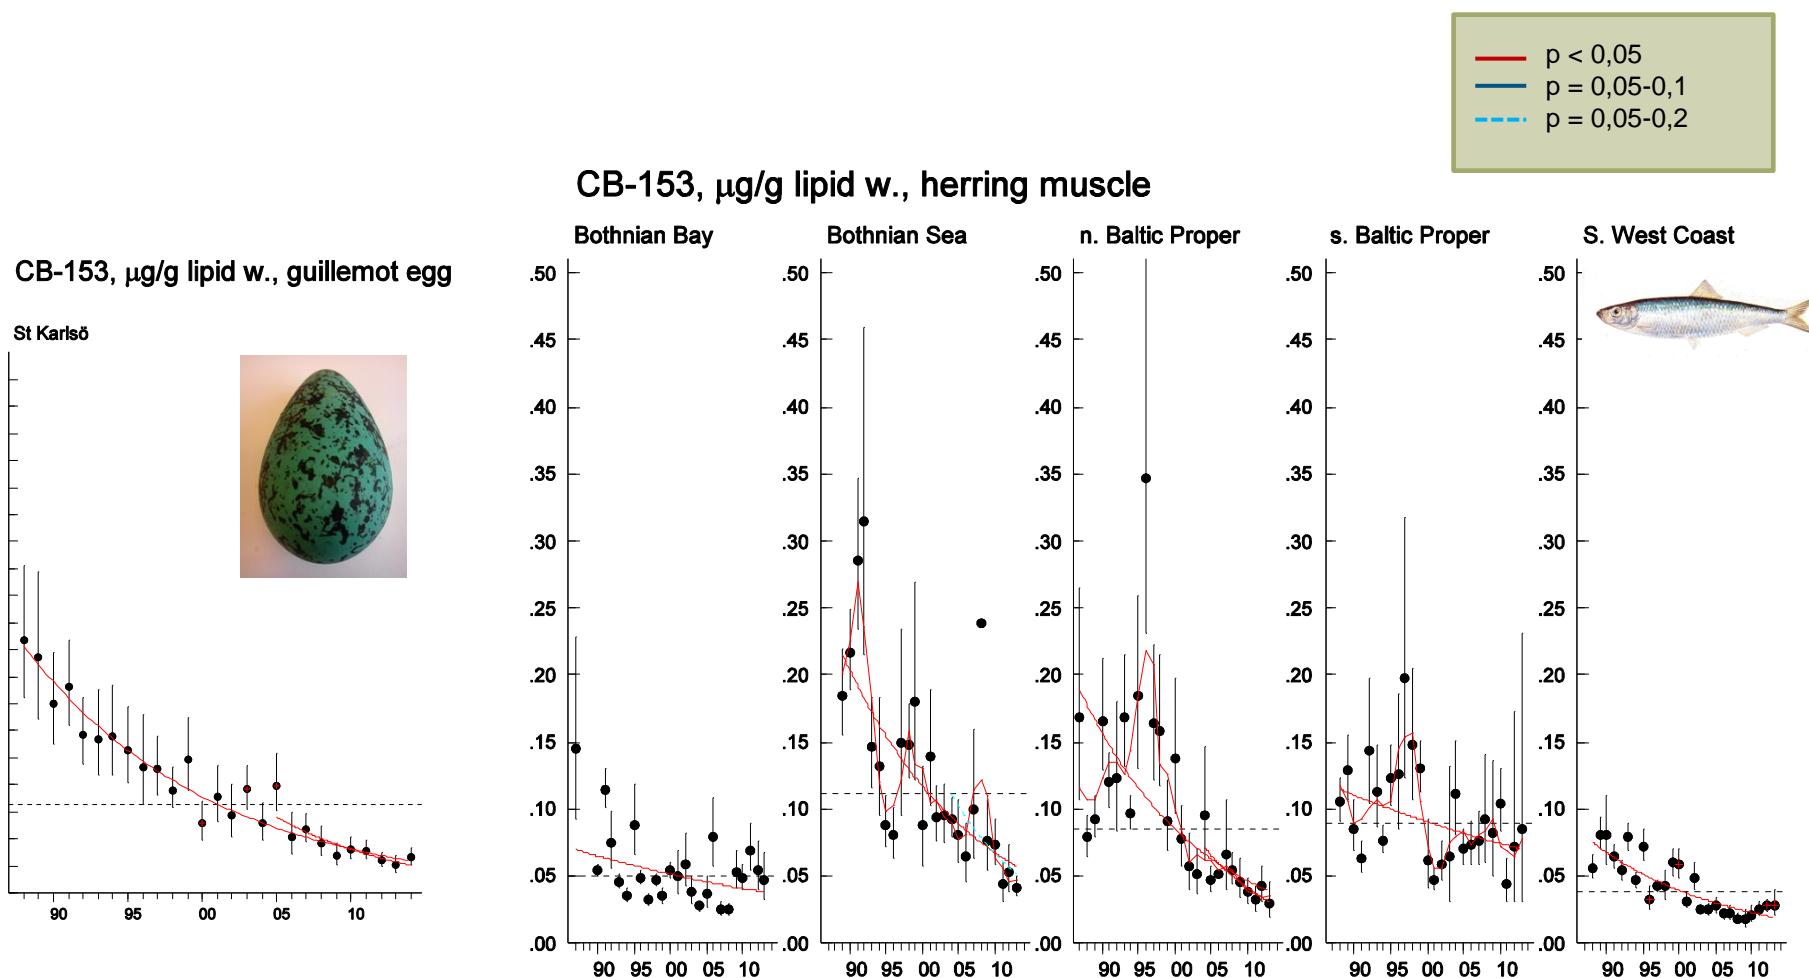

Objectives

- To describe the general environmental contaminant load and to supply reference values
- To monitor long term time trends and to estimate the rate of changes found
- Assessment against environmental target values (compliance checking)
- To indicate large scale spatial differences

- Systematic sampling since 1967
 - healthy
 - non-smokers
 - first baby
 - born in Sweden
 - sampling first three months after delivery
- 2003 – present, samples from the Mothers Milk Centre, Stockholm

CB-153 - temporal trends

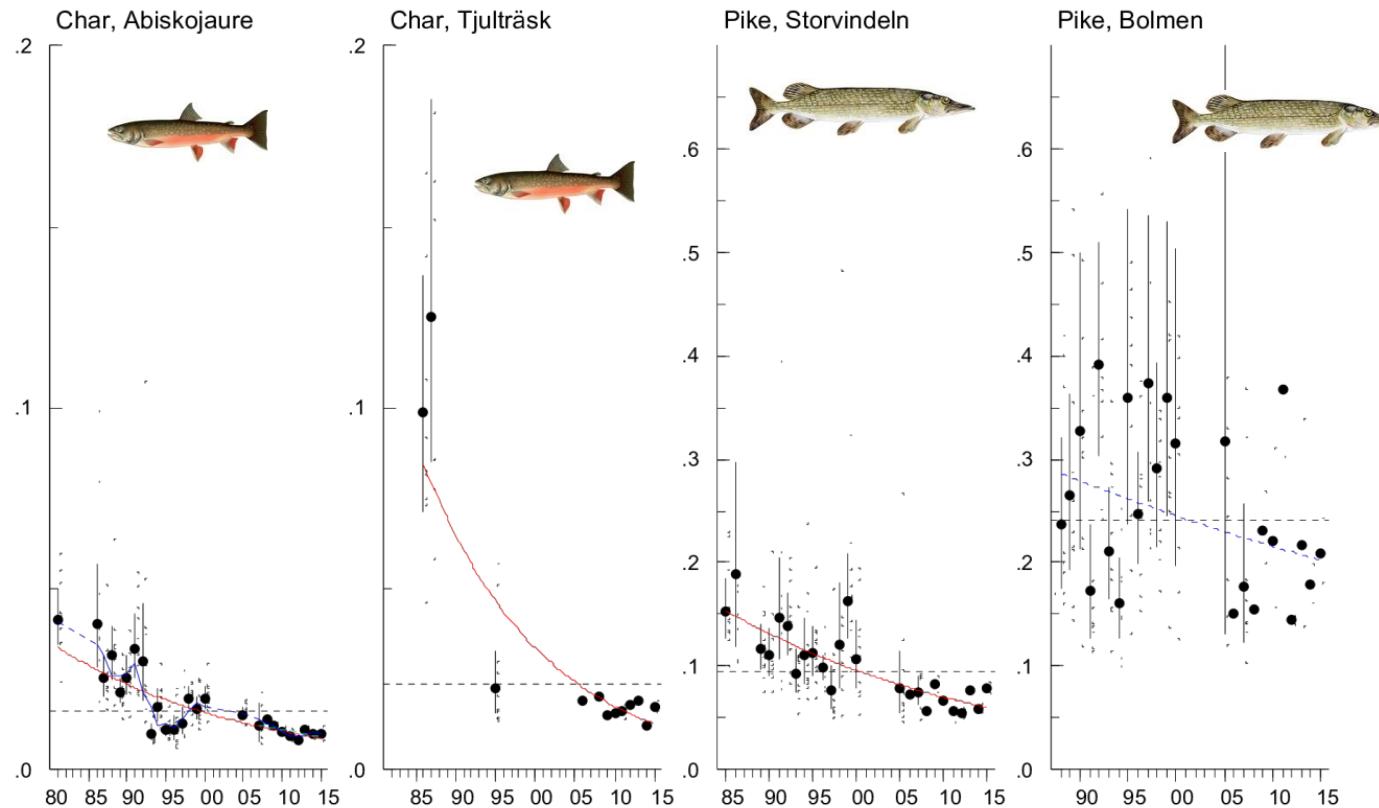

Figures from: Nyberg E., Faxneld S., Danielsson S., Eriksson U., Miller A., Bignert A. 2015. Temporal and spatial trends of PCBs, DDTs, HCHs, and HCB in Swedish marine biota 1969-2012. *Ambio* 44, 484-549.

■ 0.09 – 0.18
■ < 0.09

CB-118 - spatial trends

OSPAR EAC (CB-118) - 0.024ug/g lw

Conclusions

- Measures taken to reduce the concentrations of PCBs have had an effect
- The levels are still elevated in the Baltic Sea and CB-118 is above the target value at some sites and in some species both in the marine and the freshwater environment
- Human milk also show decreasing concentrations and the levels are similar in different regions
- Different species show relatively large between species variation

Thank you!!!
