2D-COSY, TOCSY, CLEAN-TOCSY, DIPSI2, NOESY, ROESY and ROESY2 Experiments on the AVI and AVII-600 Spectrometers

1.0 Introduction

1.1 Spectral Window Set up

The spectral window width and midpoint should be determined in a standard ^{1}H NMR spectrum before setting up a 2D-COSY, TOCSY, etc experiment. The smaller the spectral window the higher the resolution of the resulting spectrum. There should be no signals within 0.5 ppm of the upper or lower ^{1}H shift limits.

1.2 The Clean-Tocsy Experiment

The aw coded variant of Bruker's **clmlevp**r experiment is prosol compatible and includes:

>(i) **auto-calculation of d20** from the prosol table linked **p6** pulse time

>(ii) **auto-calculation of L1** rounded off to the nearest whole number from a requested **d9** spin lock time input as per a standard TOCSY experiment

>(iii) the set **d9** time is displayed as **d10** in the experiment's _**ased**_ display immediately below the requested **d9** time.

Bruker's **clmlevpr** pp notes incorrectly include 2 x p17 pulses in their manual spin lock time calculation formula. While p17 appears twice in Bruker's **TOCSY** pp's it appears only once in their **clmlev** pp's.

1.3 Processing

The COSY experiment is an absolute value experiment – no phasing is required.

TOCSY, CLEAN-TOCSY, DIPSI2, NOESY, ROESY and ROESY2 experiments are phase sensitive experiments. These spectra should be phased **before** using the **abs1** and **abs2** commands.
